Now I changed the plugin setting:

(if I enable EDIT the privacy settings in the profile edit disappears)

Now I have an Asset field at the html field!

But unfortunately I don't understand, what I have to put in into the Asset field.

I have four other fields, for that the html field is the headline. Generally the privacy setting shall be "Users" standard. By this the headline shall also shall have the same privacy setting.

But if one of the four fields under the headline is set to public, the headline must be shown also to public.

So the IDs of the four fields are:

- 100
- 101
- 102
- 103

Which setting shall I do for my need?
