WARNING - The com_comprofiler.zip package is over 2M in size.

If when trying to install you get a Joomla message:

"There was an error uploading this file to the server.",

then check that your PHP upload_max_filesize is at least

4M (recommended 16M) in your php.ini file.

Use Joomla backend to check your PHP

Information settings:

- Joomla 3.x -> System -> System

Information -> PHP Information

- Joomla 2.5.x -> Site -> System

Information -> PHP Information

- Joomla 1.5.x -> Help -> System Info ->

PHP Information

- Joomla 1.0.x -> System -> System Info ->

PHP Info

and search the page for

'upload_max_filesize' to verify that

value is more than 2M. If not, then search same page for

'Loaded Configuration File' to see the actual php.ini file

that needs to be updated. If in doubt ask your hosting

helpdesk for assistance.

IMPORTANT - CB 1.9.1 must be installed on a PHP 5.0 or better environment (PHP 5.2+ recommended). CB 1.9.1 will ****not**** install on PHP 4.0.
MYSQL 5.0 or better required. CB DOES NOT WORK ON MICROSOFT SQL SERVER.

KNOWN ISSUES: CB related 'Menu Item Type' displayed in Joomla 3.1/2.5
menu Item creation always shows 'Logout action'.

This is a Joomla bug that has been reported to Joomla team
and can be safely ignored as the link created internally
is the correct one.

This is fixed in Joomla 3.2.

During the CB 1.9.1 component installation process
on a Joomla 2.5 environment
you might briefly see a
"Failed deleting pluginfiles.tgz" error
during the first
phase of installation. This is to be ignored.

When adding new users in backend of Joomla 3.x/2.5 using the
CB User Manager, 2 welcoming email messages
will be sent to user (one from CB and one from Joomla).

This appears to be an issue with Joomla API. You can turn this off by setting the value of the

User - Joomla! plugin Notification Mail
to User parameter to No

IMPORTANT - This component does not work with any other registration or login modules or hacks. It is recommended that you uninstall all such modifications as the effects of using them with this component are unknown.

IMPORTANT - As for any installation: FIRST BACKUP your database and files.

SUMMARY OVERVIEW

- 1) Install com_comprofiler component (also known as the CB component).
- 2) Install mod_cblogin module (also known as the CB Login module).
- 3) Install mod_comprofilerModerator module (also known as the Workflow module).
- 4) Install mod_comprofilerOnline module (also known as the CB Online module)
- 5) Enable CB Login, CB Workflows and CB Online modules
(see detailed instruction for Joomla 3.x/2.5 related module positioning on default Joomla 3.x/2.5 template)
- 6) Select Name Style parameter from Community Builder Configuration and Save.
Run Community Builder Synchronize Users tool.
- 7) Disable Joomla/Mambo login modules
- 8) Add new Public menu item to Community Builder component *** IMPORTANT ***
- 9) Add new User List menu item
- 10) Run Load Sample Data tool (optional)

- 11) Adjust Community Builder and Joomla/Mambo CMS settings to allow registrations only through Community Builder
- 12) Done!

DETAILED INSTRUCTIONS TO INSTALL CB 1.9.1

1) Install com_comprofiler.zip as a component. (see notes below first)

NOTE: Please be patient. com_comprofiler.zip is large (2.0+ MB) and takes

time to upload and install (sometimes over 5 minutes on large sites !).

The installation of CB will be done automatically in 2 pages (2 step process), which will load automatically.

Please wait for the green message saying that installation is finished.

In case of problems, see troubleshooting section further down in this file.

NOTE: PHP Safe mode must be off for component and plugins installation in Joomla! 1.0.x and Mambo.

NOTE: Mambo 4.6.0 - 4.6.5 don't handle multiple xml files properly, so:

a) you need to first unzip com_comprofiler.zip, remove the files ending with j.xml and g.xml and the access.xml file and re-zip before installing on these Mambo versions.

b) For each module used below, you need to unzip the package, replace the XML file which is inside the "files" folder by the one which is outside that folder, and then rezip the "files" folder for Mambo 4.6.

IMPORTANT: if install fails, see "In case of failed install section" below.

2) Install mod_cblogin.zip as a module.

IMPORTANT if you use the core Joomla or Mambo login module the users will become out of sync with community builder.

NOTE: Go to Joomla/Mambo Admin->Components->Community Builder->Tools

And use the synchronize users tool to synchronize your user database if this happens.

3) Install mod_comprofilerModerator.zip as a module
This module is also known as the CB Workflows

module and it is used to

manage front-end moderation actions.

(Optional Module, only needed if using moderator features).

4) Install mod_comprofilerOnline.zip as a module

This module is also known as the CB Online module and it is used to

produce and display a list of currently logged in users with links

back to their CB user profile page.

(Optional Module, displays list of online users).

5) Enable the cblogin login module (CB Login), and other CB modules

from the administration backend (go to modules->site modules then

click on publish red cross or click on module name to set params).

NOTE: On Joomla 3.x/2.5 the 'left' module position will not show-up in

---- the default template. You need to set the module to position-7.

6) Go to Joomla/Mambo Admin->Components->Community Builder->Configuration

and at least choose the user name type (first/lastname mode choice)

corresponding to how you want to split or not split the existing users'

name during existing users synchronization of the next installation step.

Make sure to click "Save" on the configuration page.

6b)Go to Joomla/Mambo Admin->Components->Community

Builder->Tools

And use the "Synchronize users" tool to synchronize CB with Joomla.
or Mambo.

7) Disable the Standard Joomla/Mambo Login Module. To do that, go to the

administration backend then:

- in Mambo/joomla 1.0 go to modules->site modules then click on the

green publish checkmark of "Login form" (mod_login) so that it becomes a red cross.

- in Joomla 1.5 go to Extensions->modules then click on the green

"Enabled" checkmark of "Login form" (mod_login) so that it becomes a red cross.

- in Joomla 3.x/2.5 go to Extensions->Module Manager and unpublish all

instances of Login module (use Type drop-down filter to find them).

8) Add a new user menu item to the "User Menu" for Community Builder:

(this will be the link to the user's profile page).

For this, go to "Menus" -> "User Menu", click New, then:

- in Mambo/joomla 1.0 select "component", "Community Builder

(comprofiler)", leaving access public for the item,

give a name and save.

- in Joomla 1.5 click in internal links "Community Builder",

then "User Profile",

leave access public for the item, give a title and alias and save.

- in Joomla 3.x/2.5 go to User Menu (if sample data was installed)
or any other Menu published for Registered group and

click "(+) Add New Menu Item" for J 2.5 or click "+ New" for J 3.x,
then click the

Select button next to the "Menu Item Type *" field to reveal the

"Select a Menu Item Type:" pop-up window. Select the

"User Profile (mandatory)" item in the comprofiler section.

Give it a Menu Title (example: "My CB Profile") and set the

"Access" drop-down field to "Public". Then click "Save & Close".

KNOWN ISSUE: When you create any CB related menu item in Joomla 3.x/2.5

----- the Menu item type field always shows 'Logout action'

This is a Joomla 3.x/2.5 bug which has been reported.

You can safely ignore this as the populated link is the correct one.

This has been fixed in Joomla 3.2.

NOTE: This is not a security issue, CB checks access.

As you don't want this menu item to appear publicly,

you can put it in the User Menu as explained

in this step,
or another menu with Registered access level
at least.

9) Add a list menu item:

(this will be the link to the searchable users-
listing).

For this, go to "Menus" -> "User Menu" (for non-
public lists) or

"Menus" -> "Main Menu" (for public lists), click
New, then:

- in Joomla 3.x/2.5 select "Users lists" item in
the comprofiler section

- when selecting a "Menu Item Type *" for your
menu.

- in Joomla 1.5 click internal links "Community
Builder",

- then "Users-list", leave parameters as is, and
save

- in Mambo/Joomla 1.0 select Link-URL / External-
URL and point it to

- index.php?option=com_comprofiler&task=usersList
(no 'http://domain' name) and save.

NOTE: if you want the list to be accessible
publicly, make this
menu entry public (and make also public the
one under point 8)

NOTE: if you make the menu being the first of the
main menu it will
become the site's homepage.

10) [OPTIONAL]

Go to Joomla/Mambo Admin->Components->Community Builder->Tools

And use the "Load Sample Data" tool to pre-populate fields with standard user contact fields (address, phone, etc), and also create a default users list.

NOTE: To edit this default users list/add other users lists: Go to

Joomla/Mambo Admin->Components->Community Builder->List management

and change/add list(s) with the corresponding access level.

Make sure they are published.

11) [RECOMMENDED]

If you want to allow registrations only through Community Builder:

- in Admin->Components->Community Builder->Configuration->Registration:

- set "Allow User Registration" to "yes, independently of global site setting"

- in Joomla 3.x/2.5 Administration->Users->User Manager click the

- Options button and set 'Allow User Registration' parameter to 'No'.

- in Joomla 1.5 Admin->Site->Global Configuration->System:

- set "Allow User Registration" to "No".

- in Joomla 1.0/Mambo Admin->Site->Global Configuration->Site

12) Done !

Please consider supporting the CB team by becoming an Advanced, Professional or Developer member or purchasing CBSubs - the most powerful membership subscription management solution for Joomla!.

=====
=====

TROUBLESHOOTING section

IN CASE OF FAILED COMPONENT INSTALL:

- Blank screen: check error logs of your web-server, or enable PHP errors display.
Or try both fixes below blindly.

- Maximum Execution time reached:

On very slow servers, IF installation timeouts (not seen yet): you can fix that as follows: Open file:

- joomla 1.5//2.5/3.x: administrator/index.php

- joomla 1.0/mambo: administrator/index2.php

and add line

```
set_time_limit( 240 );
```

right after the <? line, remove directories components/com_comprofiler

and administrator/components/com_comprofiler and re-install.

- Memory exhausted error (sometimes Error 500):

If you get a Memory exhausted error, simply add line (similarly as above):

```
ini_set( 'memory_limit', '16M' );
```

```
@ini_set( 'memory_limit', '32M' );  
    to index2.php or index.php file (depending on  
Joomla version).
```

- Check that your PHP 'upload_max_filesize' parameter (in your php.ini) is set to something greater than 2M. If not try increasing and reinstalling.

- If component installation step 2 failed: Do not panic ! :

Just access CB component from backend, it's safe.

In all backend tasks there is a test if step 1 has been completed or not.

- If you don't see any warnings at top of screen then installation completed successfully.

- if you see a warning like:

```
"Warning: file 'components/com_comprofiler/  
pluginsfiles.tgz' still  
exists.
```

This is probably due to the fact that first installation step did not complete, or second installation step did not take place. If you are sure that first step has been performed, you need to execute second

installation step before using CB. You can do this now by clicking here:

(link: please click here to continue next and last installation step)."

Then you can just click on the link to complete the second step.

This step simply uncompresses that 'pluginsfiles.tgz' file into the same place and then deletes the file. The second step can be safely redone.

In case it still doesn't work, it's probably a permissions problem either on the folder 'components/com_comprofiler', not allowing the webserver to write into (or in case of Joomla 3.x/2.5/1.7/1.5 ftp installer active, the credentials not being correct).

You can fix that by fixing the permissions of that folder, and retry step 2.

At last resort you can uncompress pluginsfiles.tgz, and rename the resulting directory 'pluginsfiles' to 'plugin' at the same place.

You need to make sure that the plugin and all directories inside plugin (user, templates, language) are also writable, otherwise you won't be able to install CB plugins at a later stage.

UNINSTALLING CB

To uninstall CB, simply uninstall CB Component and CB modules from your CMS.

User data will be preserved in MySQL tables starting with prefix_comprofiler.

Main CB Configuration is deleted on uninstall of CB component as it is

stored in file administrator/components/com_comprofiler/ue_config.php .

CB module configurations are deleted on module uninstall, per CMS methods.

CB plugins, tabs and field configurations, as well as user data is preserved

for reinstallation (see README-UPGRADE.txt for details upgrading/reinstalling).

To remove all database records, delete tables starting with prefix_comprofiler

in a MySQL tool like PhpMyAdmin.

KNOWN PROBLEMS:

- with Joomla 3.x/2.5 during the first phase of the comprofiler component installation you may briefly see a red error on the Joomla backend stating "Failed deleting pluginsfiles.tgz" - you can safely ignore this.

- check www.joomlapolis.com forums for latest known issues.

NOTE: Community Builder includes a version checker that accesses joomlapolis website to query for the latest version of CB and, if available, latest information displayed together with the latest

version number in backend. This query doesn't disclose any private information. Only information needed for this standard http query are version number and referrer (site address). If you don't have Internet access, after a timeout of 20 to 90 seconds an error message will be displayed instead of latest version when showing your config or "about CB" from the backend. You can switch this check to "manual" in CB configuration: "integration" tab (Not recommended).
